

Free Email Verification Tool

Free online email checker for deliverability, catch-all detection, and blacklist checks.

About

Free Email Verification Tool is an email verification tool that checks deliverability, catch-all domains, and blacklist status in seconds. It is a browser-based email checker from uSpeedo that works without signup or a credit card, and it is designed to help you validate addresses before you send.

What is Free Email Verification Tool

Free Email Verification Tool is a browser-based email verification tool that tests whether an address looks reachable before you put it into a campaign. The site says it can verify an email address in seconds, check deliverability, detect catch-all domains, and identify

[Free Email Verification Tool](#)[Visit ↗](#)

blacklist status, all without signup. It is presented as part of uSpeedo, with an online checker for manual use and a batch verification API for larger jobs.

This email verification tool is focused on practical list hygiene rather than inbox management. It is meant to reduce bounce rate, protect sender reputation, avoid spam traps, and improve campaign ROI by filtering out addresses that are unlikely to work. The service also explains the technical steps behind verification, including DNS MX record lookup, SMTP RCPT TO verification, catch-all domain detection, and blacklist and risk analysis.

Key features

This email verification tool combines a simple checker with technical signals that matter for sendability.

Deliverability check: The app tests whether an address appears able to receive mail.

Catch-all detection: It looks for domains that accept mail for any mailbox, which makes per-address verification less reliable.

Blacklist status review: It checks whether the domain appears on known spam blacklists or shows disposable-email risk signals.

No signup required: You can use the checker from a browser without creating an account.

Free access: The site describes the tool as free to use.

Batch API support: The product also advertises a Batch Verification API for scale, including a request example for up to 10,000 emails per request.

The email verification tool is also transparent about why verification is tricky. It calls out greylisting, temporary errors, and ISP anti-probe throttling from providers such as Gmail and Outlook, which can affect how quickly or accurately a check completes.

How to use it

Using this email verification tool is straightforward for a single address, and the API path is available if you need bulk checks.

Open the Free Email Verification Tool in your browser.

Free Email Verification Tool

Start verification and wait for the result to resolve.

Review the output for deliverability, catch-all behavior, and blacklist or risk status.

If you need larger-scale processing, use the Batch Verification API instead of the manual checker.

For API use, the site shows a `POST` request to

`https://api.uspeedo.com/api/v1/email/BatchVerifyEmail` with Basic authorization and a JSON payload containing an `Emails` array. The documentation snippet also notes that the batch endpoint supports up to 10,000 emails per request. That makes this email verification tool useful both as a quick web utility and as a programmatic validation step.

Who it is for

This email verification tool is a fit for people who need to clean lists before sending and who want a fast answer without a signup wall.

Email marketers who want to lower bounce rates and protect campaign performance.

Founders and small teams who need to check a few addresses before outreach.

Developers who want to wire email checks into an app or workflow through the batch API.

Operations teams that care about sender reputation and list hygiene.

Anyone doing cold outreach who wants to reduce waste on invalid or risky addresses.

The tool is especially relevant when the goal is to decide whether an address is likely safe to send to, not to manage a full contact database. If you need a simple email verification tool for one-off checks, the web app is the lightest route. If you need an email verification tool at scale, the API is the more practical option.

What to know before you use it

This email verification tool is useful, but it does not eliminate every uncertainty in email validation. Catch-all domains may return positive results even when a specific mailbox does not exist, so a passing result is not always proof that the exact address is active. Greylisting and temporary server errors can also interrupt checks, which means a failed

The app also notes that major providers such as Gmail and Outlook may throttle or block probe-like connections. That means an email verification tool can be affected by the receiving server's anti-abuse controls, especially when the domain is protective or rate-limited. For that reason, the result should be treated as a strong signal, not an absolute guarantee.

It is also important to understand what this email verification tool does not do: it does not send a real message, and it does not replace ownership verification or consent checks. If you need proof that someone controls an inbox, a confirmation email from your own system is still the official route. If you need legal or compliance evidence, use your source of record instead of relying only on a checker. In short, Free Email Verification Tool is a fast email verification tool for pre-send screening, but the final decision should still account for catch-all behavior, greylisting, and your own sending policy.
